Assembly and Use

The Compaction Mould for preparation of stability test specimens consists of a base plate, mould body and collar, all available as separate items.

The mould body is made of seamless plated steel tubing. Either end of the mould body will fit the collar and the base. The collar has a larger inside diameter so that it can be used as a support in ejecting specimens.

The Marshall compaction mould may be used with either an automatic compactor or manual compaction hammer and pedestal.
